BIOL. 12:403-412(1989).

-!- FUNCTION: THIS PROTEIN FUNCTIONS AS A DEFENSE AGAINST CHITIN CONTAINING FUNGAL PATHOGENS.

-!- CATALYTIC ACTIVITY: HYDROLYSIS OF THE 1,4-BETA-LINKAGES OF N-ACETYL-D-GLUCOSAMINE POLYMERS OF CHITIN.

-!- INDUCTION: BY ETHYLENE.

-!- SIMILARITY: BELONGS TO CHITINASE CLASS IA WHICH IS SIMILAR TO CLASS IB IN THE CATALYTIC PART BUT WHICH INCLUDE A N-TERMINAL CHITIN-BINDING LECTIN DOMAIN (BELONGS TO FAMILY 19 OF GLYCOSYL

New low temperature expression chitinase gene for producing a plant grade highly resistant to psychophilic plant pathogenic microbes

Claim 7; Fig 3; 11pp; Japanese.

This invention describes novel wheat chitinase genes. The invention also describes a method for the isolation of a low temperature expression

  0;
chitinase gene in which the mRNA is extracted from a fully hardened autumn wheat P1173438 (of high snow mould resistance). The genes are useful for creating a plant grade, highly resistant to psychophilic plant pathogenic microbes.

The present sequence is winter rye (Secale cereal L. cv. Muskateer)
CHT9 preprotein. The mature protein, which is also claimed, is a
Chitianse-like protein that has chitimes (antifungal) and
antifreeze activities. CHT9 cDNA (see AAXA889) was obtained by
isolating mRNA from rye plants grown at low temperatures in the
abstract of pathogens of other stresses, i.e. under conditions when
only chitimases with antifreeze activity would be expressed. CHT9
and CHT46 (see AAW880B1-82) have been cloned and expressed in
Datterial and yeart (Pichia) systems and in Arabidopsis thaliana.
The chitimase-like antifreeze proteins can be used: to increase
freezing tolerance of plants and microorganisms to increase field
survival of plants, animals and microorganisms exposed to sub-zero
temperatures; to inhibit ice recrystallisation in biological
materials or foods; for cryopreservation and Mypotherature
of cells, embryos, tissues etc. (particularly human platelets); and
to kill tumour cells. They are also used to inhibit initiation and
properserved biological material. The signal peptide can be used
to to direct protein secretion in transgenic organisms or expression
everages.

New nucleic acid encoding antifreeze polypeptides from plants -
particularly with chitinase activity, used to impart frost, and
pathogen, resistant to plants, for preservation of foods, cells etc.
and for treating tumours

cobtained by isolating mRRA from tree plants grown at low temperatures ochtained by isolating mRRA from rep plants grown at low temperatures in the absence of pathogens or other stresses, i.e. under conditions in the absence of pathogens or other stresses, i.e. under conditions of the childrases with antifreeze activity would be expressed. CHT9 and CHT46 (see AAN9908182) have been cloned and expressed in bacterial and yeast (Pichia) systems and in Arabidopsis thaliana. The childrase-like antifreeze proteins can be used; to increase field survival of plants, animals and microorganisms; to increase field survival of plants, animals and microorganisms exposed to sub-zero temperatures; to inhibit ice recrystallisation in biological materials or foods; for cryopreservation and hypothermic protection of cells, embryos, tissues etc. (particularly human platelets); and progression of diseases or spoilage caused by low temperature pathogens (particularly fungi) in plants, frozen foods and any cryopreserved biological material.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid encoding antifreeze polypeptides from plants - particularly with chitinase activity, used to impart frost, and pathogen, resistant to plants, for preservation of foods, cells etc. and for treating tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is winter rye (Secale cereal L. cv. Muskateer) CHT9 mature protein. It lacks the 20-amino acid signal peptide of the preprotein (see AAW98079), which is also claimed. Mature CHT is a chitinase-like protein that has chitinase (antifugal) and antifreeze activities. CHT9 preprotein cDNA (see AAX24889) was
winter rye, antifungal; fungicide; cold tolerance; frost tolerance; transgenic plant; preservation; cryopreservation; tumour; therapy.

The sequence given is encoded by the rice chitinase gene. The promoter region of this gene (see AAQ31407) is responsive to physical and/or biological stress. The pattern of expression of this protein in mature plants is characteristic. There is a low level of expression in mature leaves, a moderate level in plant stems and the highest level in roots and the male and female parts of the plant. The chitinase promoter sequence may be linked to a reporter gene for expression in mono- or dicotyledon plants. Expression of this reporter gene may be used to study patterns of development and controlled expression of plant defence genes and selectable genes. 60 N-----GCSGGTPVPVPTPSGGGVSSIISQSLFDQMLLHRNDAACLAKGFYNYGAFVA 112 61 srlrrrrpdasgg-----ggsgyasivsrslfdlmllhrndaacpasnfytydafva 112 113 AANSFSGFATTGSTDVKKREVAAFLAQTSHETTGGWPTAPDGPYSWGYCFNQER-GATSD 171 17; Gaps 1 MRGVVVVVAMLAAAF-AVSAHAEQCGSQAGGATCPNCLCCSKFGFCGTTSDYCGTGCQSQC 59 /note= "Region conserved between class I and class II chitinases" i. This invention describes novel wheat chitinase genes. The invention also describes a method for the isolation of a low temperature expression chitinase gene in which the mRNA is extracted from a fully hardened autumn wheat P1173438 (of high snow mould resistance). The genes are useful for creating a plant grade, highly resistant to psychophilic plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 291

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a chitinase designated RCHIO. The specification describes chimeric receptors which are used for modulating plant responses to pathogens. The receptors comprise a heterologous extracellular domain (e.g. from a Bril protein or RCHIO protein) and a kinase domain (e.g. from disease resistance protein Xa21). The Xa21 gene is a member of disease resistance protein Xa21). The Xa21 when Xa21 is present in a transgenic plant, it confers resistance to Xanthomonas spp.. The plant receptors containing heterologous domains are useful for modulating plant responses to pathogens including viruses, bacteria, nematodes, fungi or insects. The nucleic acids can be used to
                                                                                                                                                                                                                                                                                                                                                                        Disease resistance protein; Xa21; RKK gene; transgenic plant, chitinase; Xanthomonas; plant pathogen; Bril protein; RCH10 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chimeric plant receptors comprising a polynucleotide encoding a RRK receptor containing a heterologous extracellular domain and a kinase domain from a Xa21 polypeptide, useful for modulating plant responses

Attachment of the signal peptide ensures occlusion of expressed prod. in the vacuole while elimination of the signal peptide from a sequence normally conty, it ensures that the expressed product is secreted into the extracellular space, rather than retained in the vacuole. Recombinant DNA may contain a structural gene which protects the plant, e.g. resistance to pathogens, herbicides, insecticides, biocides, environmental stress, etc.; leads to pharmaceuticals such as hormones or immunommodulators.                                                                                                                                 This recombinant tobacco chitinase gene prod. is encoded by a genomic close, lambda CHNI7 which comprises 3 exons and has 5' - and 3' - untranslated regions. A fragment (claimed) from the 5'-untranslated region can be used to increase the ex-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DB 12; Length 331;
                                                                                                                                                                                                                   pression of foreign genes in transgenic plants. The fragment is linked to a foreign gene, eg chithnase or glucanase gene via a spacer and is also linked to regulatory sequences. The resultant DNA construct is used to transform plant cells, eg tomato or tobacco, which subsequently produce the gene product at high level.
used to increase expression of foreign genes in transgeni
plants, partic for improving resistance to pathogens etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    24..324

to construct a transgenic plant in a novel method to produce plants resistant to fungal attack. Such transgenic plants expressing an intracellular plant chitinase gene and a plant beta-1,3-quucanase gene within its tissues are predicted to exhibit improved resistance to pathogenic fungi. Such genes should be operably linked to promoters and terminators and optionally a gene encoding a selectable or screenable trait. Plants that overexpress the chitinase and glucanase genes exhibit a synergistic antifungal effect.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      246

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents an extracellular chitinase. The specification describes transgenic plants which express a chitinase gene and a glucanase gene. The expression of the chitinase and beta-1,3-glucanase genes produces an antifungal effect. The transgenic plants are useful for improving plant resistance to pathogenic fungithe recombinant polynuclectides and the process are useful for producing fungal resistant plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New transgenic plants expressing chitinase and glucanase have improved resistance against pathogenic fungi, particularly against Alternaria alternata or Fusarium oxysporum f. sp. lycopersici

The inventors claim a new recombinant gene which codes for a protein with encochitinase activity, or its precursor (see AAQ21007). The coding part of the gene contains at least the 5' part of DNA for tomato endochitinase and at least the 3' part of DNA for the tobacco enzyme (DNA can be genomic or CDNA, but at least one intron is prefigerable. The recombinant gene includes the 35s promoter of cauliflower mosaic virus plus the terminator from the nopaline synthase gene of Agrobacterium tumefaciens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        7 VAMLAAAFAVSAHAEQCGSQAGGATCPNCLCCSKFGFCGTTSDYCGTG-CQSQCNGCSGG

This sequence is encoded by the cDNA clone pHS2, and represents a protein having chitinase-activity derived from american elm. This protein inhibits the fungus Ophiostoma ulmi, the causative agent of dutch elm disease. The clone pHS2 may be used to transform E. coli cells for the recombinant production of the chitinase-like protein. The protein may be used in a composition to inhibit fungal infection of elm trees.
                  Isolated chitinase gene derived from an American elm - used obtain prods. for inhibiting fungal infection of plants
                                                                                    Claim 1; Fig 1; 12pp; English.
